

The North (San Francisco) Bay  
Climate Adaptation Initiative:  
How can we build climate resilience into our  
communities at the county scale?

National Adaptation Forum, April 3, 2013

Dr. Lisa Micheli, Executive Director, Pepperwood  
Co-chair NBCAI Science Working Group and TBC3

# Pepperwood Foundation

mission  
to advance science-based conservation throughout  
our region and beyond

The new Dwight Center for  
Conservation Science

3200-acre reserve in eastern  
Sonoma Co, originally gifted to CA  
Academy of Sciences

Pepperwood  
PRESERVE

Inspiring conservation through science

making the global local to learn how to cope  
with climate change

# North Bay Climate Adaptation Initiative (NBCAI)

a coalition of natural resource managers, policy makers and scientists committed to working together to create positive solutions to the challenge of climate adaptation in Sonoma, Napa and Marin Counties.

Inspiring conservation through science

## Why a county-scale approach to climate adaptation?

Because land and water management, infrastructure investments, open space protection, and emergency response in our region all lie in the hands of primarily county or municipal decision-makers and private landholders.

For example, over 85% of the land in Sonoma County is privately held.

Scientists:  
What do  
people need to  
know about  
climate  
change to plan  
effectively?

A dialog about  
what's  
important:  
in CA water is  
important!

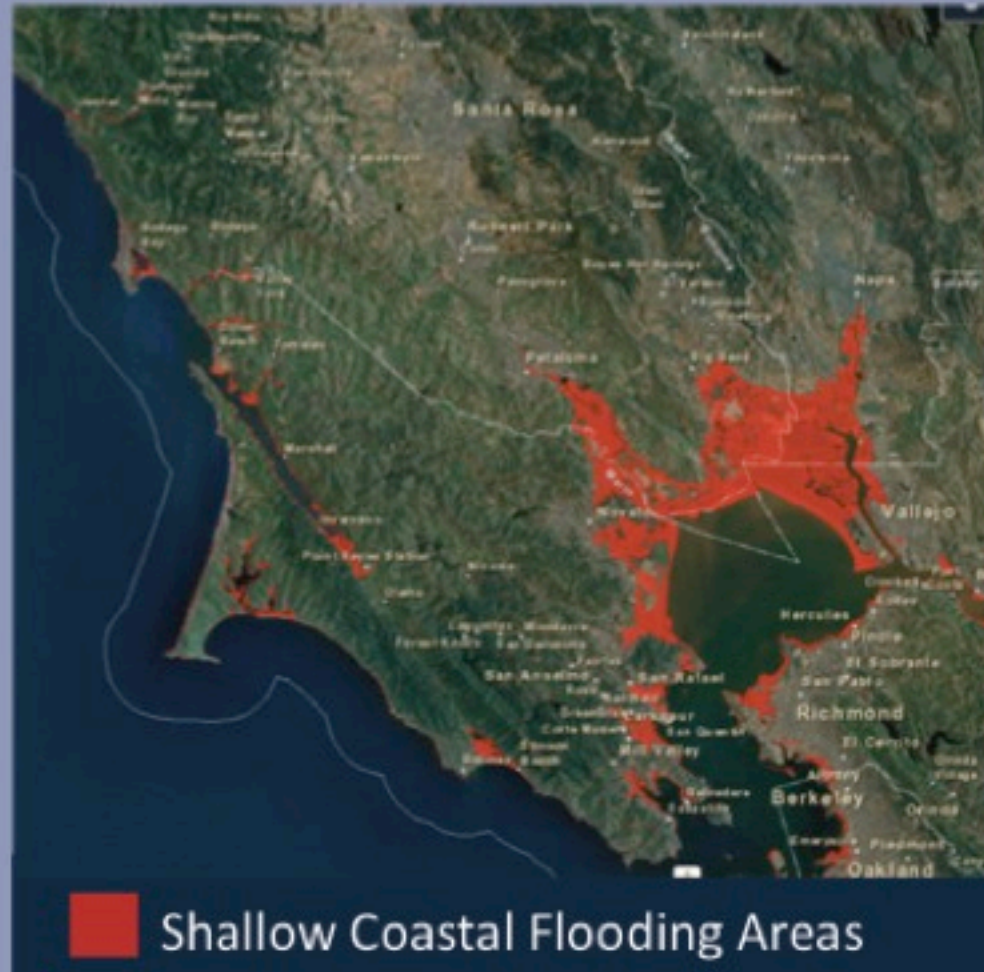

**Our region is a  
leader in  
tackling  
climate  
mitigation and  
now adaptation**

Managers:  
What can the  
scientists tell us  
about climate  
vulnerability that  
we can use to do  
our jobs?

## North Bay sea level rise

Previous studies have explored risks of sea level rise-our goal was to address upland impacts of climate change to integrate into this picture

The red layer represents areas currently subject to shallow coastal flooding. A sea level rise of 3 feet is estimated to increase the number of days of flooding per year in these areas by a factor of 150.

# Basin Characterization Model

Flint and Flint USGS

To get at  
important issue  
of available water  
for people and  
ecosystems!

Solves the physical  
water and energy  
balance based on  
topography, soils,  
rainfall, and temp for

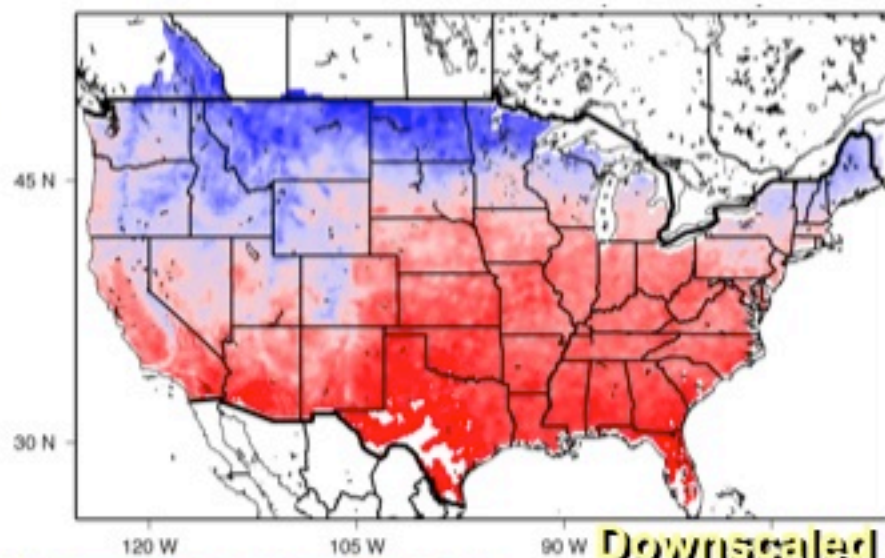

every pixel in  
domain—to estimate  
flows, recharge and  
soil moisture

# TBC3 downscaled climate-hydro scenarios (not predictions!)

- Global Models: from 275-km to 12-km to 4-km to 270m, climate and hydro

# Downscaled climate for Sonoma County: current and future conditions – 4 scenarios

+1.5 ° F  
since 1900

+8 ° F by  
end of  
century?

Much higher  
uncertainty  
about future  
rainfall than  
temperatures!

*Climatic Water Deficit in South Bay*

*Google Earth Image of South Bay*

soil water deficit correlates to vegetation cover-this  
late summer deficit is projected to increase even  
with higher winter rainfall

**Major Basin Comparisons:**

**Water Deficit increase steeper than Temp**

**Under both warmer drier and warmer wetter scenarios, climatic water deficit increases on the order of 10-20%, additional water needed to maintain vegetation cover (natural or crop)**

# Penetrating the mysteries of fog.....

Maps of future climatic water deficit scenarios for CA suggest increasing late summer aridity under all scenarios, will fog mitigate this effect, if so, how much and where?

Data suggest Pacific coastal fog is in decline. Is this related to climate change? How will it affect coastal species and habitats?

Take home

The future is expected to be  
**warmer and drier**

(in terms of late summer aridity)

regardless of whether the North Bay experiences more or  
less rain as a result of climate change

the uncertainty is about how fast these changes will occur  
and this is in our hands as a global community

in order to adapt locally we need to start measuring  
patterns of change now and  
pursue “no regrets” policies!

So what?

# Implications for watershed management of conservation lands

change in vegetation cover to communities tolerant of more arid conditions (and more fire-prone?)

loss of habitats that require high soil moisture to support sensitive species. We can preserve the ball park, but the players are going to change!

protected headwaters will grow more important for fisheries, flood control and groundwater recharge

## Mean Ripening Date

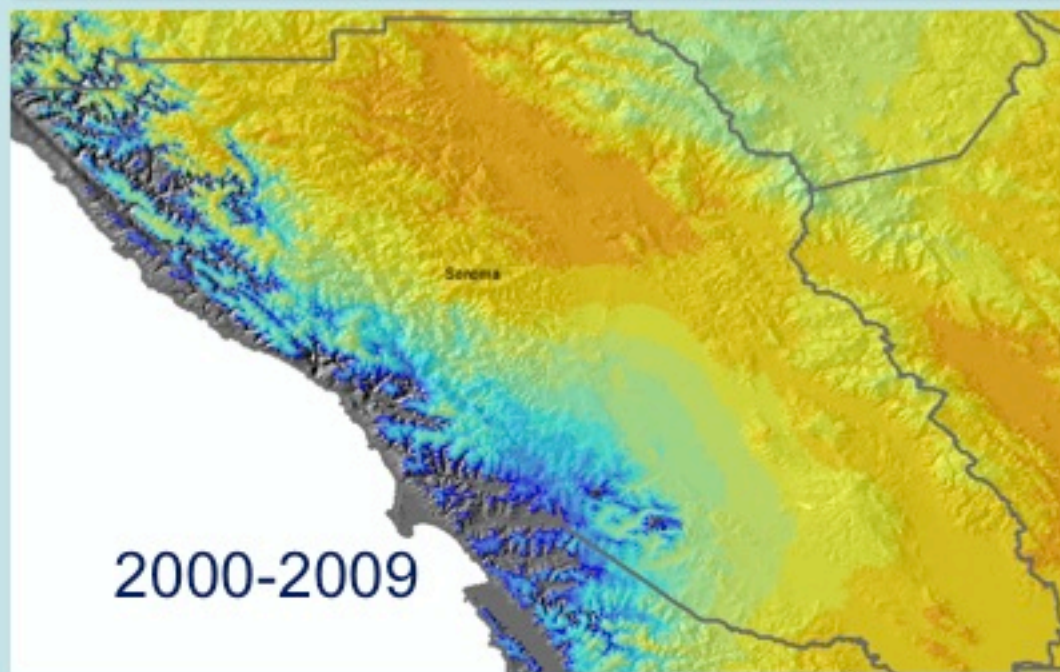

Group 5 1250 DD

## Climate Change in the North Bay

for residents of Marin, Sonoma and Napa Counties

As over the rest of the globe, the climate in the North Bay region has already started changing in response to greenhouse gas emissions.<sup>1</sup> By looking at long-term weather station data, scientists have been able to confirm that our climate has warmed compared to the historical record.<sup>2</sup> Between 1911 and 2000, average maximum temperatures have increased approximately 1.0 °F while average minimum temperatures have increased approximately 1.7 °F.<sup>3</sup> The maps below depict changes in monthly maximum and minimum temperatures averaged over the last 30 years (1971-2010) compared to a pre-climate change period of the same duration (1911-1940). While some parts of the region (in blue) have cooled over this time period, the overall warming trend (in orange) is clear across the region.

### Recent climate trends in the North Bay

Change in Minimum Temperatures  
(30-yr averages for 1911-1940 vs. 1971-2000)

Change in 30-year averages of monthly temperature lows showing an average warming trend for the region of approximately 1.7 °F.

Maps produced from California Basin Characterization Model data (Flint and Flint, USGS) available on the California Climate Commons.

Change in Maximum Temperatures  
(30-yr averages for 1911-1940 vs. 1971-2000)

Change in 30-year averages for peak monthly temperatures, showing a warming trend for the region of approximately 1.0 °F.

### Why should we care?

Changing temperatures are already starting to impact our communities in terms of personal health and energy, water and land use. This is because climate dictates:

- o The quantity and quality of our water supply and patterns of water demand
- o Rates and patterns of commercial and residential energy use
- o How and where farmers can grow crops
- o Health risks for vulnerable populations including the very young and elderly

*By raising awareness in our community about the impacts of weather variability in our own region, we can prepare for the future through effective long-term planning.*

<sup>1</sup> Hansen, J et al., 2000. A Closer Look at United States and Global Surface Temperature Change. *J. Geophys. Res.*, 106, 23947-23963, doi:10.1029/2001JD000154.  
<sup>2</sup> Micheli, L et al., 2012. Downscaling Future Climate Projections to the Watershed Scale. *San Francisco Estuary and Watershed Science*, 10(4), jnse\_sflow\_11170.  
<sup>3</sup> 1965. Flint, J and Flint, A, 2011. California Basin Characterization Model (BCM) Downscaled Climate Surfaces. California Climate Commons, Petaluma, CA.

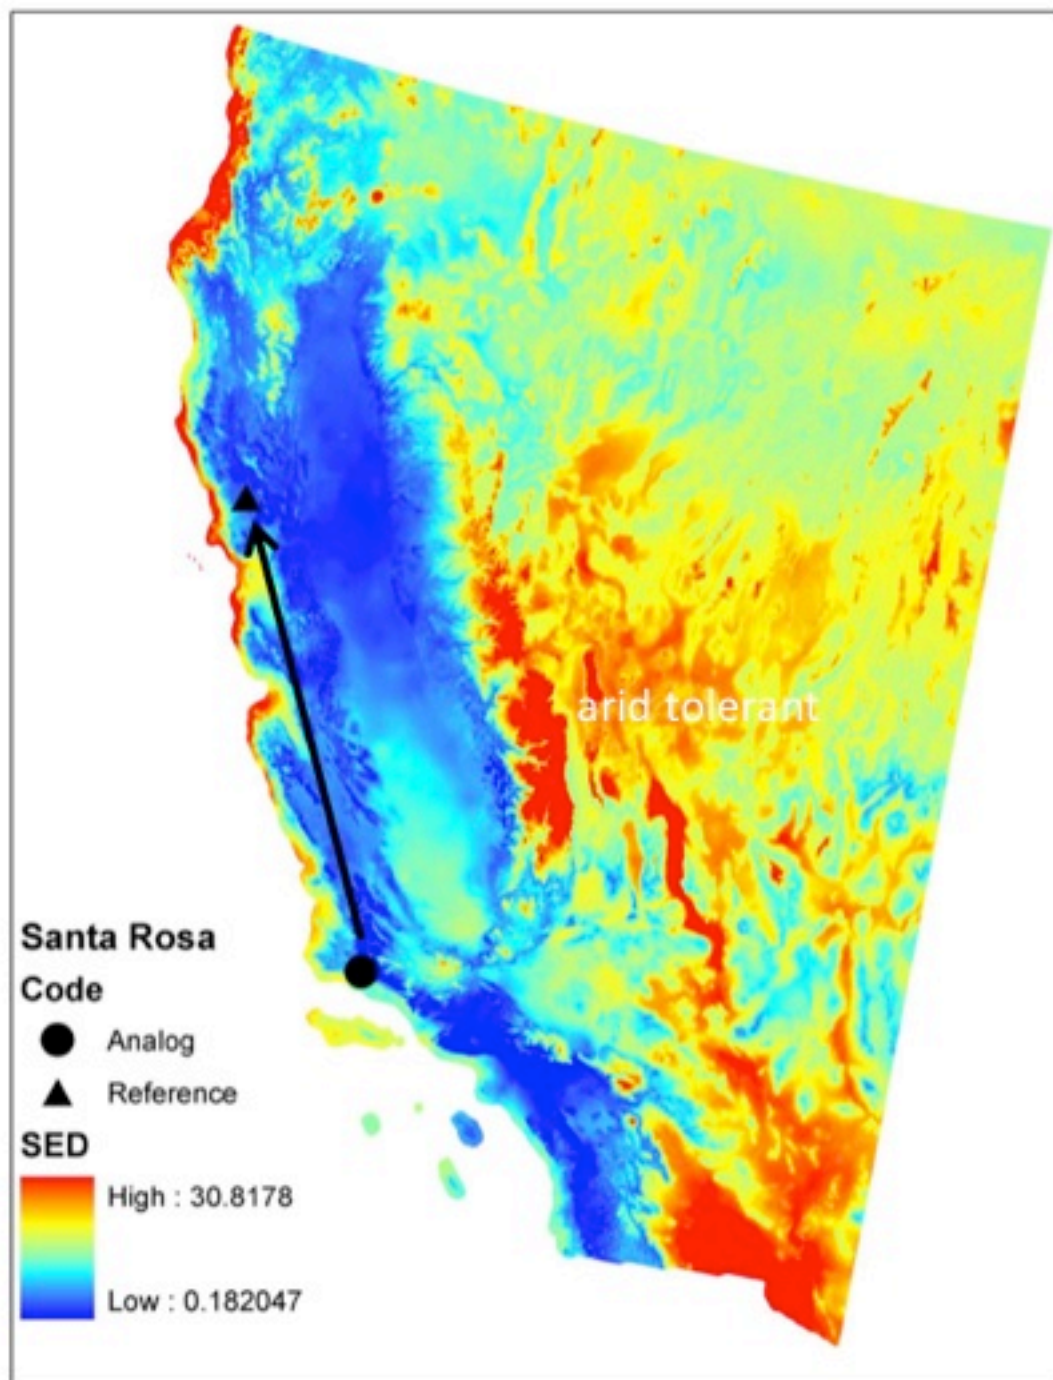

# Outreach Goal

Raise awareness that climate change is underway and measurable

## Fact Sheet Series-

1. Science summary of impacts
2. Planning and policy implications
3. Waterways
4. Forest stewardship

## Outreach Goal

Make our  
vulnerabilities  
tangible

where in CA  
has the  
climate now  
we anticipate  
for Santa  
Rosa for  
2100?

Inland Santa  
Barbara County?

## Outreach Goal

**Build an appreciation for ecosystem services**

Including the potential to protect human communities against the harmful effects of climate change

Healthy ecosystems provide free “services” to human communities, including: water filtration, groundwater recharging, stormwater control, air purification, nutrient recycling, crop pollination, and soil enrichment.

What can we do to create climate resilient communities in the North Bay?

Identify and implement “no regrets” strategies,  
many already in play.

coupling climate-ecosystem  
measurements

advancing real-time monitoring  
in So Co and across region

sharing data

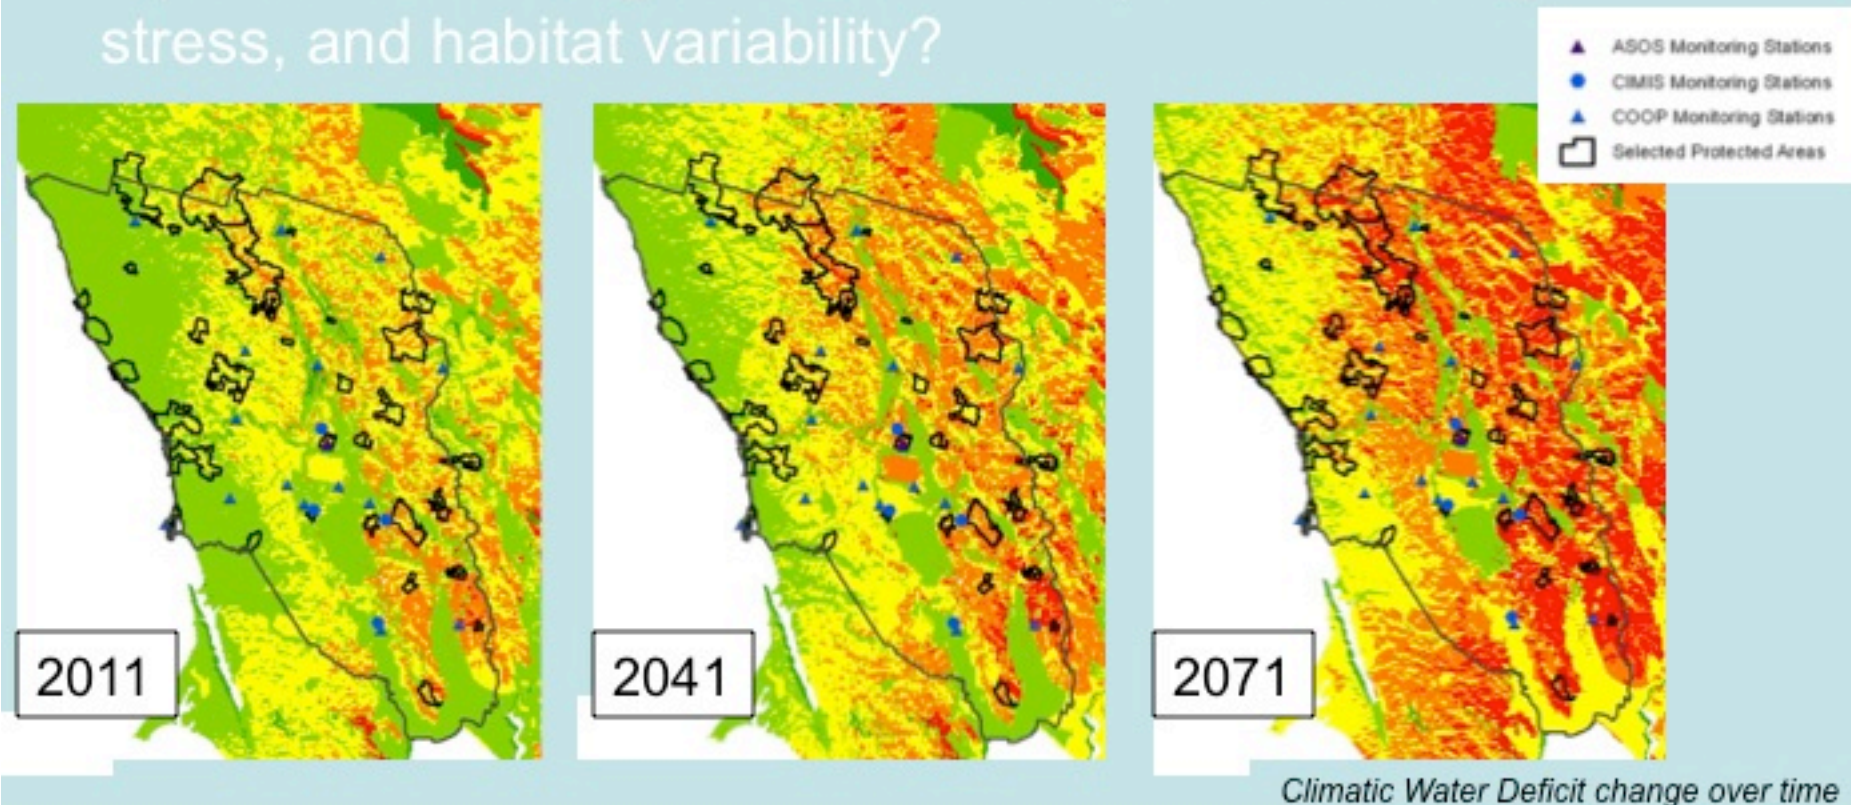

creating a community of  
practitioners

disseminating lessons learned

we need cost-effective means of measuring  
climate in concert with biotic “vital signs

Where should we locate monitoring stations for a representative range of iso-climates, climate change stress, and habitat variability?

- Map the range of Sonoma County's current and future iso-climates and habitat variability
- Select representative preserves for potential monitoring sites
- Install weather, hydrology, and biological monitoring stations
- Important for flood and drought warnings!

# Water

diversify supply portfolio \*  
increase efficiency of all  
uses \* pursue water  
catchment and reuse at all  
scales\* increase distributed  
storage \* enhance  
groundwater recharge and  
underground storage \*  
buffer streams and  
floodplains \* apply “green  
infrastructure” for flood  
control \* restore marshes to  
protect from sea level rise

# Agriculture

enhance water security\*  
increase soil moisture  
holding capacity \* plan  
crops to minimize “burn”  
risk \* protect resilient  
farmlands \* distribute  
food production \* use high  
tech to time irrigation and  
frost protection \* convert  
to crops tolerant of higher  
aridity \* create shared  
“cooling centers” for  
produce storage and  
transport \* track pests

# Health

identify and train sensitive populations \* prepare emergency heat centers \* monitor disease vectors \* add shade to exposed environments \* raise bar for emergency response \* be fire and flood ready \* increase neighborhood capacity to respond to extreme events \* provide planning guidelines for new developments \*

# **SOLUTIONS** are in the hands of **local citizens and governments**

When risks to water resources and biodiversity,  
continued efforts to *mitigate* (reduce) greenhouse  
gases are worth it!

Counties and Cities need to develop and  
implement adaptive measures: coordinate long-  
term land, water, infrastructure planning and  
emergency response

Water conservation and catchment are more  
important than ever! Approaches to enhance soil  
moisture holding capacity?

We must monitor real-time climate change to  
actively refine adaptation responses over time!

[northbayclimate.org](http://northbayclimate.org)

thank you!
